DSRC

DIGITAL TACHOGRAPH DATA

Digital tachograph data

In view of the upcoming implementation of the new EU Road Traffic Control Directive in August 2024, it is worthwhile to become thoroughly familiar with the DSRC device and the possibility of equipping WIM stations with such devices. Discover the modern solution of the WIM Pro with DSRC antenna an innovative combination that provides access to the data of the digital tachograph together with the data of the HSWIM.

With an external DSRC antenna placed on the support structure above the road, authorized services can access important data from digital tachographs together with information from weigh stations at high speeds. This solution combines all the benefits of HSWIM stations and digital tachograph reading stations. Because the DSRC antenna is permanently installed on the support structure, it does not need to be reinstalled, significantly reducing the time and effort required by enforcement agencies. In addition, visual images can be used to easily identify vehicles that require detailed inspection.
