Learn more about Control Pro

Control Pro uses easy-to-implement mechanisms to integrate existing ITS components and allows expansion with new devices. System software allows an integration of various detection, monitoring, and control subsystems, creating a multimodal traffic management platform.

The most commonly used subsystems managed by Control Pro include variable message signs, meteorological systems, CCTV cameras, CB-radio and automatic number plate recognition cameras.

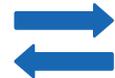

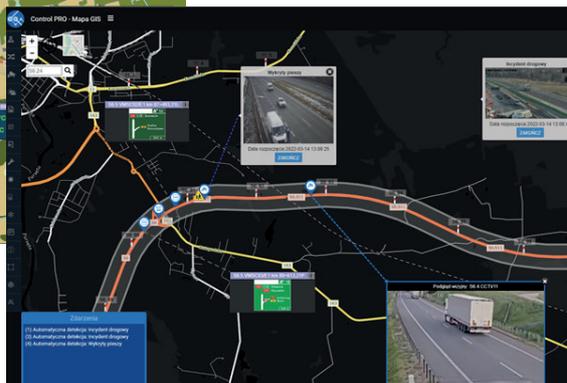

SOFTWARE

It is a scalable software that combines a number of functionalities within a single platform. It allows the implementation of appropriate traffic management strategies to improve traffic flow and increase road safety.

Control Pro has an intuitive graphical user interface, dedicated to Traffic Management Centre operators and supporting year-round infrastructure maintenance functions.

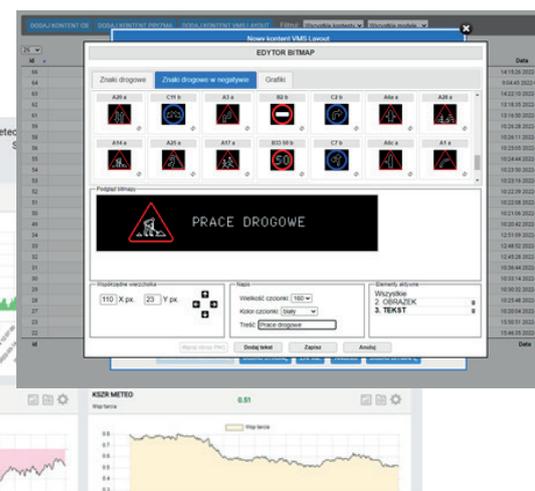

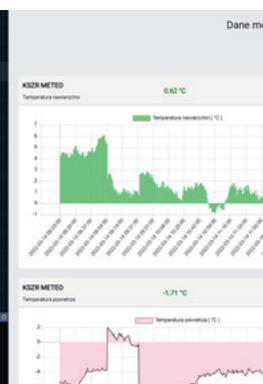

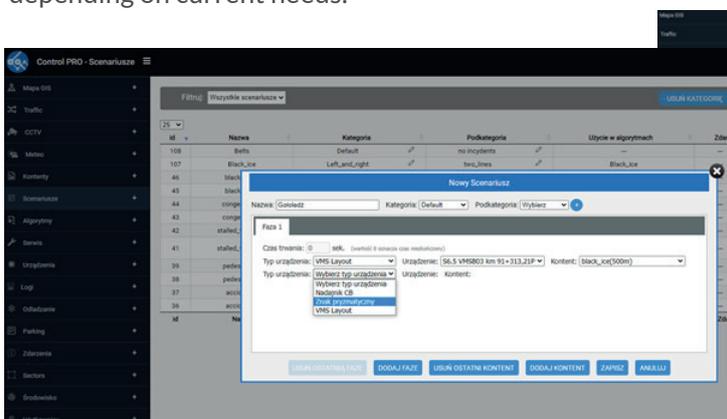

The platform interface is easy to use and allows the desired function to be called up in a minimum number of steps.

The Control Pro platform allows data to be exchanged with other traffic management systems – for example using the Datex 2 protocol.

The user can, among other things, independently configure traffic management scenarios and event alarms, depending on current needs.

The operator has various modes of operation available for the system or its individual components. The system has a data archiving and reporting module to verify the work of operators. It is possible to integrate the system with various video data recording solutions.
